Apple EtherTalk Card: Supports TCP/IP With NCSA Telnet

This article last reviewed: 7 January 1988

The National Center for Supercomputer Applications offers NCSA Telnet Version 2.1e, a communications program that supports TCP/IP with the Apple EtherTalk card.

Telnet Version 2.1e includes file transfer and Tektronix terminal emulation. Because network access is via NuBus, and is not bottlenecked by the AppleTalk port, performance is better than with FastPath.

Although Telnet Version 2.1e is in public domain, there is a charge for handling and diskettes. (Specify the Macintosh version.)
