Macintosh-to-TenNET Connectivity

This article last reviewed: 13 September 1989

TOPIC -----

Does anyone know of a Macintosh product that lets a Macintosh communicate with a PC that is running 10Net. 10Net, from what I have been told, is a network package that runs on IBM PCs, but I can't find any information about it.

DISCUSSION -----

We were unable to locate 10Net. However, there is a PC-based product called TenNET from TenNET Communications. Their PC LAN is based on the 802.3 standard, supporting 1MBps on twisted pair and 10MBps on either thick or thin coax.

TenNet Communications suggests that their users use QuickShare by Compatible Systems for accessing any PC hard disk from a Macintosh. This software/hardware product connects a SCSI port from a PC to the SCSI port on the Macintosh. It also supports text and bitmap graphics translations.

For more information, search the Tech Info Library under "TenNET Communications" and "Compatible Systems."
