ABS Tech Note: DAL19 CL1Init XCMD (6/92)

Article Created: 30 June 1992

TOPIC -----

This technical note describes clarifies the "Data Access Language Programmer's Reference" for CL1Init XCMD.

DISCUSSION -----

The documentation in the "Data Access Language Programmer's Reference" indicates that the CL1Init XCMD "parallels" the CL1Init API. This is true except during error processing. If an error is encountered by the CL1Init XCMD, the XCMD will call CLGetErr and CLEnd before returning to HyperCard. The error information that the XCMD gets from CLGetErr is returned to HyperCard in the CL1 globals as defined in the "Data Access Language Programmer's Reference."
