## WS 8150: Getting Started Manual Error (5/95)

Article Created: 12 May 1995

TOPIC -----

In the Workgroup Server (WS) 8150 "Getting Started" manual on page 15 it states, "it is recommended that you lock the power switch on by turning it to the horizontal position. In the case of power failure, the server will start up automatically. ... When the power switch is locked on, you cannot turn the computer off by choosing Shut Down."

Our WS 8150 does not start up automatically when choosing the Shut Down command from the Special menu with the power switch is locked. Is there something we are doing incorrectly, or is our Workgroup Server's power switch feature, as described in the manual, not really functional?

DISCUSSION -----

Engineering reports that the Power Macintosh 8100 and WS 8150 computers are behaving correctly. The documentation is not correct. If you choose the Shut Down command the computer will shut down, no matter if the power switch is locked on or not. We will inform the documentation department about this error, but we do not know when changes will be made.
