Apple Workgroup Server 95 Read Me (8/95)

Article Created: 12 August 1995

TOPIC -----

This article is the ReadMe Apple Workgroup Server 95 Software upgrade.

DISCUSSION -----

This Read Me file describes the changes made to the Apple Workgroup Server 95 since its original release. You can use the Software Upgrade to upgrade your system either from the original release or from the Tune Up release. This software upgrade includes the following software.

- A/UX 3.1
- AppleShare Pro 1.1 (installed only when an earlier version of AppleShare Pro is found on the system)
- Apple DocViewer 1.1
- Retrospect 2.0Ci

Notes On Installing The Software Upgrade

=====

Installation takes approximately 20 minutes. The installation instructions on the back cover of the Apple Workgroup Server 95 Software Upgrade CD, along with the on-screen messages, will guide you through the installation process. The following notes provide important additional information.

Space Requirements

The software upgrade requires 10 MB of free space on the root (/) volume. To complete the software upgrade process, you temporarily need approximately 20 MB of free space on the / volume. To check the amount of free space available, double-click the icon for the / hard disk. Then, if you aren't already viewing the window by icons, choose By Icon from the View menu. The amount of available space on / is shown in the upper-right corner of the window that displays the contents of /.

Before Installing, Check Your Applications Folder

Before installing the upgrade software, make sure that the following applications reside in the Applications folder on the root (/) volume; successful

upgrading of these applications depends on it: AppleShare Pro Admin, AppleShare Pro File Server, Retrospect, TextEditor, Apple HD SC Setup, and Apple DocViewer

Note that the Applications folder name starts with a leading space: "<space>Applications". If you change the name of the folder that contains the these applications, you must include the leading space at the beginning of the name for the upgrade to install completely.

Prompts for Older Versions

You will be prompted to replace newer versions of the LaserWriter and Chooser files on the root (/) volume with older ones; the older version is actually newer -- the creation dates on these files were incorrect in the original AWS 95 software.

Preferences in A/UX Startup

The upgrade software returns the preferences to their default settings. If you had modified the settings in the Preferences menu in the A/UX Startup application, you'll need to reenter your settings. These preferences determine whether A/UX automatically boots upon startup, the command that the system runs to check the root file system at startup time, whether parity checking is enabled, etc.

User Accounts on the Server

If you have created user account(s) on your server, and given them personal system folders, you must manually update the personal system folder for each user account after installing your system software. To update a personal system folder, log in to the user account and start the AWS 95 Upgrade Installer application. Use the Custom Install option to install the package "AWS 95 A/UX System Folder Upgrade" to the personal system folder for that account. This must be done for each personal system folder on your server.

Size of the A/UX Buffer Cache

If you had previously adjusted the size of the A/UX buffer cache on your server, check that your setting has not been changed by the installation procedure. If it has been changed, you'll need to reenter it.

Re-linking On-line Manuals

After completing the software upgrade, you may need to re-link the on-line manuals in the new DocViewer collection document called "AWS 95 Documentation." To re-link the files, open the collection document in the Documentation folder. Then double-click on one of the on-line manuals. When the "can not be found" dialog box appears, click the Locate button. Locate the DocViewer file, then use the Save command from the File menu to save the collection document. Repeat this procedure for each on-line manual in the collection document.

Network Launch Fix File

You'll notice a file called Network Launch Fix on your AppleShare Pro CD. This file fixes a bug that affects AppleShare client machines of the Macintosh Quadra, Centris, and Performa 470 series of computers (which all have the 040 microprocessor). You don't need to add this file to client machines other than the 040 series, or to your server.

GENERAL NOTES

=====

The upgrade software improves performance in several areas, including a 400 percent increase in the speed of AppleShare Pro over AppleShare 3.0 in certain areas. See the new guide, "Tuning Server Performance and Adding Internal Drives" to learn about measuring and tuning the performance of your Apple Workgroup Server 95.

Software Enhancements

- The "config_server" script for preparing the system for database or file and print services.
- UNIX Library for AppleTalk Printer Access Protocol (PAP) servers.
- Support for UNIX file systems of 4 GB in size (AppleShare Pro is limited to 2 GB)
- A version of sendmail that offers more security.
- The capability to disable the autologin feature by pressing CONTROL-X when the system is about to start the Finder environment.

Hardware Enhancements

- Support for automatic mounting and unmounting of removable media SCSI drives from the Finder.
- The Apple Ethernet NB Twisted-Pair Card.
- Support for up to five internal hard drives, and for the 2 GB Apple internal drive.

A/UX Buffer Cache Default

The setting of -1 is still the default setting for the server offering file and print services. However, the action triggered by this setting has been changed to prevent the occurrence of paging of virtual memory when AppleShare Pro and Retrospect are run simultaneously.

Don't Install CD-ROM Driver Files

CD-ROM driver files are delivered with Apple CD-ROM drives and with third-party drives. Don't copy these files to your A/UX System Folders; installing these drivers is unnecessary and will prevent your system from starting up the Finder environment.

Apple 2 GB Drive at System Startup

If your server is equipped with an Apple 2 GB hard drive, there is a slight chance that the system software might check for the hard drive before the drive

has reached full speed, and as a result, the system might not start up correctly. If this situation arises, no icon for the startup disk will appear. Restart your system; the hard drive will be recognized the second time.

Symbolic Links Changed to Increase Security

To increase system security when AppleShare Pro is running, a change has been made to the behavior of symbolic links when the symbolic link involves files in more than one folder. The change causes the check for access permissions to treat the Macintosh environment as having the level of permissions of "NOBODY". This change affects the Finder and Macintosh applications, only occurs when AppleShare is running, and does not affect the CommandShell application.

Some MacDriver Partitions Incorrectly Recognized

Apple Computer has recently released HD SC Setup Version 7.2.2. This version of the disk partitioning application creates a MacDriver partition that is not understood as a valid MacDriver partition by the A/UX version of HD SC Setup. (The A/UX version of HD SC Setup is the version used by the AWS 95.) The partition that creates the problem is called MacDriver and has the partition type "Apple Driver43". The misunderstood partition causes the following behavior when using the HD SC Setup application or using HD SC Setup from within the AWS 95 Installer:

- You cannot update the partition; in the main dialog box of HD SC Setup, the Update button is greyed out.
- You can create a second MacDriver partition; after selecting "Partition...", the dialog boxes allow you to create an additional MacDriver partition. If you encounter one of these problem MacDriver partitions, remove it and create a new one using the A/UX version of HD SC Setup delivered with the AWS95.

Limit on File System Check Command

When the Apple Workgroup Server 95 starts up, the fsck command is run from the A/UX Startup application. When the fsck command is run from the A/UX Startup application, it cannot check a file system larger than 2 GB. Therefore, limit the size of your root file system to 2,097,151 KB so that the root file system can be checked at system startup. Once A/UX is running, the fsck command can check file systems as large as 4 GB.

Install Driver for the Apple Ethernet NB Twisted-Pair Card

If you are using this new interface card, install the driver on the volume named MacPartition. Installing the file on MacPartition assures that the server will use EtherTalk rather than switching to LocalTalk each time you restart the server.

CORRECTIONS TO MANUAL PAGES

A few commands are incorrect as they appear onscreen in the manual pages. The

corrections are as follows.

"newconfig" manual page

If you're adding support to your system for an Ethernet card, these are the modules you need to specify in the "newconfig" command:

ao - Built-in interface for Apple Ethernet.
as - Apple Ethernet NB Card (a half-length card).
ae6 - Apple EtherTalk NB Card (a full-length card).
ac - Apple Ethernet NB Twisted-Pair Card.

An error appears in the last paragraph of the Descriptions section: "bnet_dr" should be "bnet".

"NETADDRS" manual page

The value of interface_id is as follows:

ao0 - for built-in interface for Apple Ethernet (which is found in the
AWS 95)
ae0 through ae5 - for Apple EtherTalk NB Cards
as0 through as5 - for Apple Ethernet NB Cards
ac0 through ac5 - for Apple Ethernet NB Twisted Pair Cards

BUG FIXES

=====

A/UX Kernel

-
- AppleShare Pro servers will now appear correctly in the Chooser on client machines.
 - AWS 95 no longer crashes if NFS clients have more than eight active supplementary groups. The server can recognize the first eight group IDs only.
 - Heavy use of the UNIX file system no longer causes system or process deadlock/panics.

A/UX Macintosh Environment

-
- The Finder now maintains information properly on file systems containing more than 160,000 items.
 - The File Manager allows you to change the case of a filename containing a slash character ('/').
 - Text files that contain both CR's and LF's are no longer interpreted as UNIX binary files. They are now interpreted as DOS TEXT files.
 - The Finder no longer terminates after rebuilding the desktop.
 - Aliases to UNIX symbolic links resolve to the target file, not the sym-link.
 - You can subscribe to a publisher that has a slash character ('/') in its name.

Retrospect

-
- The Macintosh environment no longer hangs because of loss of communication with a Retrospect Remote client.
 - Scheduled backups now occur at the correct time.

Compatibility With Other Applications

- Think C now runs under A/UX.
- Adobe Photoshop no longer crashes with a disk error when it creates files bigger than the available free space on the volume.

UNIX Utilities

- The "catsearchd" utility is now set to "respawn" instead of "once" in "/etc/inittab."
- fsck
The "fsck" utility no longer ignores the -y option when the -p option is also specified.
By default, both the "A/UX Startup" application and the A/UX system startup script "/etc/bcheckrc" invoke "fsck" with both of these options.

For

Developers

- The Printer Access Protocol (PAP) server library is included in the software. The PAP server library is contained in the file "/usr/lib/libpaps.a". For information on the PAP Server Library, see the Tech Notes for the AWS 95 which are available through AppleLink.
- The "popen(3)" subroutine now supports 128 files, the maximum number of files supported by the standard I/O library routines. In the previous release this support was limited to 20 files.
- Float and double support were fixed in the RPC library routines (libc).
- When the current directory is a mount-point and a symbolic link is in the same directory, the "getwd(3)" routine returns the target file instead of the symbolic link as it did before.
