MacWorkStation: The X003 and X004 Exec Modules

This article last reviewed: 12 April 1989

This article describes the difference between the X003 Invoke Exec Module and the X004 Call Exec Module.

The X003 Invoke Exec Module command actually runs the external procedure. You call this module after you have loaded the procedure and want it to execute for the first time to initialize its structures and perform its function.

The X004 Call Exec Module command passes data to an external procedure that has already been run by the X003 command. The data is passed in the "msgData" field of the TRMsg record that is sent to your external field.
