## ADB Keyboard: Cure for 'Dead' Keyboard

Some users have reported that their ADB keyboard are sometimes 'dead' (though the mouse works fine) when they start up a Macintosh II or SE. One reported cure has been simply to unplug the keyboard then plug it back in.

Caution: this fix works only if the mouse is plugged into the second ADB plug on the back of the computer. If the mouse is plugged into the keyboard, the fix (unplugging the keyboard then plugging it in again) crashes the system.
