HyperCard 1.2.1: Supports Multilaunch Over AppleShare

This article last reviewed: 11 October 1988

HyperCard 1.2.1 on an AppleShare File server is a multilaunch application -- provided HyperCard and its Home stack are in a folder with read-only access.

If HyperCard is launched by a user with read/write access, HyperCard cannot be run by another user. This has not changed with the new versions of AppleShare.

As long as a stack is locked, the stack can be accessed from a file server by more than one user. Neither HyperCard or the stacks are multiuser, and stacks cannot be written to by more than one user at a time.
