System 7: File Sharing Is Not the Same as AppleShare File Server

Article Created: 10 January 1992

Article Change History

09/10/92 - REVIEWED

- For technical accuracy.

TOPIC -----

I have a Macintosh running system software version 7.0 and sharing one folder. No one uses this computer; it acts as a file server only. The folder sharing function works fine with up to 10 users logged on. However, when an eleventh user tries to log on, one of these two messages appears:

- File server will not allow any users to log in. Try again later.
- Too many AppleTalk connections in use. Try again later.

The documentation says that up to 250 users are allowed per System 7 server.

DISCUSSION -----

Your Macintosh SE/30 is not a dedicated server. It is a system running the system software version 7.0 file sharing option. With that configuration, you are limited to 10 users.

To make the Macintosh SE/30 a dedicated file server, you need to install and run the AppleShare File Server software.
