Macintosh System 4.2: Problems Displaying Text

This article last reviewed: 14 January 1988

Some Macintosh users who have updated from System 4.1 to 4.2 have discovered problems with their screen fonts -- for instance, certain letter pairs occurring too close together, causing some difficulty reading the characters.

There is a problem with the new system software which may on occasion corrupt the Fond resource. To correct the offending Fond resource, the user will need to remove the offending fonts (all sizes) using Font D/A Mover 3.6, and reinstall them. This action will force the font table in the Fond resource to be recreated, correcting the problem.

Also, in Microsoft Word 3.01, under the Print option, there is a selection for either printing with or without fractional widths. The option default is for NOT using fractional widths, and must be selected to obtain correct spacing with LaserWriter fonts.
