TOPIC -----

I have a hard drive which I would like to be able to connect to any Macintosh, from a Macintosh Plus to a Macintosh IIfx.

Will the lower-end Macintoshes operate if the hard drive is using System 6.0.7?

DISCUSSION -----

System 6.0.7 is compatible all the way down to the Macintosh Plus; the only real requirements are 1MB of RAM and 800K disk drives. Your hard drive should work fine.

The one thing to remember is that you do not want to use this external hard drive you will be carrying around as the startup drive, because the installer scripts for each machine is different. In other words, you need to set up the system software for a particular machine. This would cause a problem if you used the hard drive as the startup drive on different model macintoshes. The only exception would be if the machine you connect it to is set up with the same installer scripts as the hard drives system software.
