TOPIC -----

I need a set of database programs that run on both the Macintosh and PC and can use a common set of relational database files on a server (multi-user type).

I know that some Macintosh products can read and run dBASE, but do they work on a network?

DISCUSSION -----

Omnis 5 from Blyth Software and FoxBASE+ (used with FoxBASE+/LAN) from Microsoft both allow data files to be shared in a combined PC and Macintosh network environment.

FoxBASE+ includes tools that allow simple entry/retrieval forms to be drawn, and these tools can generate the code to handle the simple forms. FoxBASE+ also can directly use dBASE code from Borland International's dBASE.

We are not aware of a multi-user relational database that works on both platforms on a network and does not use a programming language.

To locate a vendor's address and phone numbers, use the vendor's name as a search string.
