TOPIC -----

A customer would like to know if a Quadra 650 can be powered from 110 volts DC?

Why ? He wants to use it on a building site where this is the only power supply available.

DISCUSSION -----

The power supply in the Quadra 650, which is also used on the Mac IIvx and Power Macintosh 7100, is designed only to accept an AC input signal. The critical components in the power supply will not work and will most likely sustain serious permanent damage if a DC input is applied to the power supply.
