SCSI Devices Cannot be Shared Between Computers

Article Created: 18 April 1991

Article Last Updated:

TOPIC -----

Is there any way a single SCSI device can be connected to two Macintosh computers, with a switch box for example?

DISCUSSION -----

The SCSI protocol doesn't allow dynamic switching or interruption of the power and signal lines in the cable. For this reason alone, a switch box would create havoc in a SCSI chain--at the minimum causing all types of data transfer errors and possibly even blowing a device. We know of no way to connect one SCSI peripheral to two computers.
