LaserWriter IISC: Can Print Any Screen Font

This article last reviewed: 23 March 1988

The LaserWriter IISC can print any bit-mapped screen font -- including those you create yourself using programs such as Fontastic Plus -- not just the ones supplied with the system.

For optimum printing resolution, it's best to have the 4x font available, but not essential. If the 4x font isn't available, the Font Manager will look for the next best font to scale:

- a font twice the size of the desired four times font
- a font half the size of the desired four times font
- the next larger font
- the next smaller font or the display font.

If the 4x font isn't available, it is advisable to choose Text Smoothing in Page Setup.

Using the Altsys program Fontographer, you can convert any Altsys PostScript font into a rough bit-map screen font. We'd recommend then using the Altsys program Fontastic Plus to edit the rough screen font into something more suited for printing.

For more information on Fontographer or Fontastic, search the Tech Info Library for Altsys.
